

## AI TOOLS UTILIZATION

### How I Utilize AI Tools for Development

I primarily use **Cursor Editor** as my AI-enhanced development environment. Here's how I leverage it for coding and other development tasks:

1. **Code Autocompletion and Generation**
  - Cursor Editor helps me with smart autocompletion for Odoo's ORM methods, reducing development time.
  - I use it to generate boilerplate code for models, views, and business logic, ensuring consistency and accuracy.
2. **Bug Fixing and Debugging**
  - The AI's suggestions help me quickly identify and resolve syntax errors or runtime issues, making the development process more efficient.
3. **Code Refactoring**
  - I use AI-assisted recommendations to refactor complex or repetitive code into smaller, more readable functions.
4. **Documentation Assistance**
  - The tool helps generate docstrings and comments for methods, ensuring that the code is well-documented for easier collaboration and maintenance.
5. **Idea Exploration**
  - I leverage the AI's ability to suggest alternative approaches or optimizations for Odoo-specific workflows and business logic.

Using AI tools like Cursor Editor enables me to write better code, reduce errors, and accelerate the development process while maintaining high-quality output.
